

Mobile POS for a US based Retail Solution Provider

Business Need	With the revolutionary changes in the retail industry, retailers were moving from traditional and customary solutions to more technology oriented and customer friendly retail solutions
Challenges	The retail solution provider wanted to keep pace with the US retail market trends and wanted to add a mobile POS to his service offering to capture the new gen retailers. The customer wanted to bring down the hardware Capex and introduce cost effective and handy devices for the POS operations
Solution Offered	Tejasco designed and developed an android based mobile POS (Point of Sale) solution which could be used by any retailer. The cost of android devices came handy for retailers and the solution could offer more than the traditional POS solution which came with a heavy hardware pricing. The solution also helped the retailer to create mobile counters rather than fixed sale counters which indirectly helped him effectively manage his real estate and create customer delight
Technology Stack	Android Studio, Java, SQL-Lite, MYSQL, Java Swing
